

# SILICONE COSMETIC PROSTHESIS FOR UPPER LIMBS

Finger | Half Finger  
Partial Hand | Total Hand

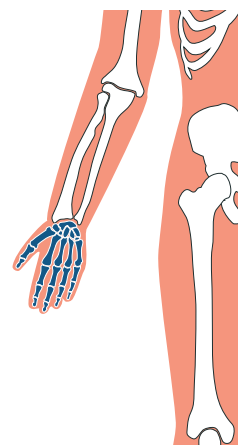

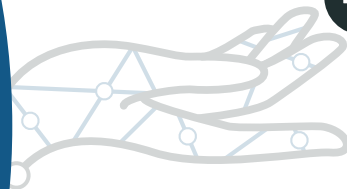

The more the amputation is minimum, more important is **the sense of details**. So, the aesthetic details are very important in the amputation of fingers. Procosil takes into consideration all the technical steps such as the taking of imprints and measurements, coloring of the prosthesis, the adjustment of the stump, the realization of the nail... in order to create a prosthesis that **is exactly the same as the contralateral healthy limb**.

The knowledge of our know-how permits us to reproduce a prosthesis for **any type of stump**, even strange stumps, starting from a finger to half finger from partial hand to hand.

Even though a **good prosthesis** is not only the creation of the contralateral healthy limb, it must also respond to the **personal and functional aspects** of the patients. Our aim is to realize a prosthesis **the most identical** to the healthy hand (in its morphology, color of skin, global aspects and details) also keeping in consideration the function of the stump.

**Our technology**, listening always to the patients aspects, permits us to respect his decisions and **preference**, by suggesting him always based on **our experience**.
