

FINGER ARTICULATION SYSTEM

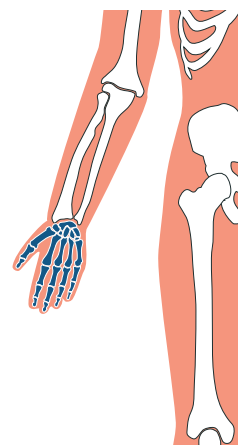

F.A.S. is provided with a **self-locking mechanism** that ensures the positioning and **maintenance in position** of the prosthetic fingers.

This system is to be found in amputations of hand and partial hand, in particular, **when the patient has the function to use the thumb**, in this case creating the function of a pinch.

The F.A.S. is provided with a system that permits the **automatic return of the fingers** in relaxing position.

The applications and quality of life are different for each patient so, F.A.S. **could be a solution** for the expectations of each person.
