

SILICONE COSMETIC PROSTHESIS FOR LOWER LIMBS

3D Foot

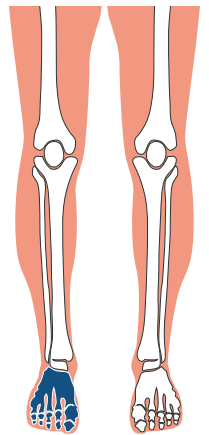

Custom-designed and manufactured based on a 3D-printed mold, following approval of the test foot (see sheet "Design and Development of the manufacturing process for a prosthetic test foot"). This is an **aesthetic foot prosthesis**, made with intrinsically pigmented silicone and final shading applied using photographic reference.

- Allows for the application of silicones with different **Shore hardness levels**, tailored to the patient's specific needs.
- Particularly suitable for **voluminous or hypersensitive residual limbs**.
- **Nails** available in silicone or resin.

Design Foot

Custom-designed and fabricated following the approval of the test foot, this prosthetic foot achieves the **highest level of aesthetic realism**. It is manufactured using a **monolithic mold** that accurately replicates the patient's contralateral sound limb.

- **Coloring** is performed by a **specialized orthopedic technician and colorist** in the presence of the patient for optimal shade matching.
- Nails available in silicone or resin.
