

# SILICONE COSMETIC PROSTHESIS FOR LOWER LIMBS

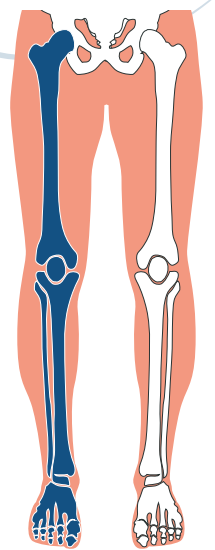

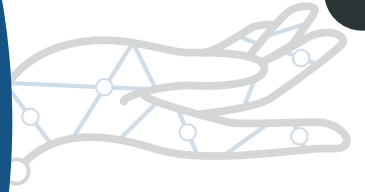

## 3D Tibial/Femoral Silicon Cover

The 3D tibial or femoral cover is a custom-made solution based on a 3D-printed support.

- **Coloring:** Achieved through photographic reference.
- **Nails:** Available in silicone or resin.

The cover is fabricated starting from the finished transtibial or transfemoral prosthesis, which is sent to us. We then design and manufacture the cover to ensure a perfect fit over the prosthesis and its socket.

The foot of the cover is meticulously crafted to replicate the contralateral sound foot as closely as possible. This is achieved through the **customization of the foot shell**, which is engineered to integrate the carbon blade while precisely matching the internal volume and dimensions of the prosthetic cover. Without this step, it would not be possible to maintain the proportions and volume of the patient's natural contralateral foot.
